Disaster Recovery

We're ready for a rainy day, even if it's a hurricane

Disasters strike every day, but businesses need to know that work will go on. EVP Systems has a **publicly available, documented, and tested** disaster recovery and business continuity plan, and the technical infrastructure to back it up. Whatever happens, **we will be there for you**.

Redundant Data Centers

To avoid any single point of failure, EVP Systems has two full data centers, each independent from each other. If one fails for any reason, all evaluations are automatically routed to the other. Each has enough capacity to handle the full load.

Multiple Offices

Like our data centers, EVP Systems has two physical offices, separated by over 70 miles. Should one office need to be shut down, the other can immediately take up all its functions, continuing to serve our clients.

Documented Details

EVP Systems has publicly released its "Disaster Recovery and Business Continuity" documentation. It details our technical and business infrastructure, including backup methods, testing process, and plans to fully recover from a disaster.

A Tested Plan

We test the automatic failover of our technical infrastructure every quarter, and completely close one of our offices twice a year, just to make sure that things work as they should. If disaster strikes, we know we're ready.
